```
“<?xml version="1.0"?> <optimize simulator="simulator_name" evaluator="evaluator_name" algorithm="algorithm_name" nsimulations="simulations_number" iterations="iterations_number" tolerance="tolerance_value" nbest="best_number" npopulation="population_number" ngenerations="generations_number" mutation="mutation_ratio" reproduction="reproduction_ratio" adaptation="adaptation_ratio" direction="direction_search_type" nsteps="steps_number" relaxation="relaxation_parameter" nestimates="estimates_number" threshold="threshold_parameter" norm="norm_type" p="p_parameter" seed="random_seed" result_file="result_file" variables_file="variables_file">
<experiment name="data_file_1" template1="template_1_1" template2="template_1_2" ... weight="weight_1"/> ...
<experiment name="data_file_N" template1="template_N_1" template2="template_N_2" ... weight="weight_N"/>
<variable name="variable_1" minimum="min_value" maximum="max_value" precision="precision_digits" sweeps="sweeps_number" nbits="bits_number" step="step_size"> ...
<variable name="variable_M" minimum="min_value" maximum="max_value" precision="precision_digits" sweeps="sweeps_number" nbits="bits_number" step="step_size">
</optimize> “
```

with:

- **simulator**: simulator executable file name.
- **evaluator**: optional. When needed is the evaluator executable file name.
- **seed**: optional. Seed of the pseudo-random numbers generator (default value is 7007).
- **result_file**: optional. It is the name of the optime result file (default name is "result").
- **variables_file**: optional. It is the name of all simulated variables file (default name is "variables").
- **precision**: optional, defined for each variable. Number of precision digits to evaluate the variable. 0 apply for integer numbers (default value is 14).
- **weight**: optional, defined for each experiment. Multiplies the objective value obtained for each experiment in the final objective function value (default value is 1).
- **threshold**: optional, to stop the simulations if objective function value less than the threshold is obtained (default value is 0).
- **algorithm**: optimization algorithm type.
- **norm**: error norm type.

Implemented algorithms are:

- **sweep**: Sweep brute force algorithm. It requires for each variable:
 - *sweeps*: number of sweeps to generate for each variable in every experiment.

The total number of simulations to run is:

$$(\text{number of experiments}) \times (\text{variable 1 number of sweeps}) \times \dots \times (\text{variable n number of sweeps}) \times (\text{number of iterations})$$
- **Monte-Carlo**: Monte-Carlo brute force algorithm. It requires on calibrate:
 - *nsimulations*: number of simulations to run in every experiment.

The total number of simulations to run is:

$$(\text{number of experiments}) \times (\text{number of simulations}) \times (\text{number of iterations})$$
- Both brute force algorithms can be iterated to improve convergence by using the following parameters:
 - *nbest*: number of best simulations to calculate convergence interval on next iteration (default 1).
 - *tolerance*: tolerance parameter to increase convergence interval (default 0).

- *niterations*: number of iterations (default 1).
It multiplies the total number of simulations:
x (number of iterations)
- Moreover, both brute force algorithms can be coupled with a direction search method by using:
 - *direction*: method to estimate the optimal direction. Two options are currently available:
 - * *coordinates*: coordinates descent method.
It increases the total number of simulations by:
(number of experiments) x (number of iterations) x (number of steps) x 2 x (number of variables)
 - * *random*: random method. It requires:
 - * *nestimates*: number of random checks to estimate the optimal direction.
It increases the total number of simulations by:
(number of experiments) x (number of iterations) x (number of steps) x (number of estimates)

Both methods require also:

- *nsteps*: number of steps to perform the direction search method,
- *relaxation*: relaxation parameter,

and for each variable:

- *step*: initial step size for the direction search method.

- **genetic**: Genetic algorithm. It requires the following parameters:

- *npopulation*: number of population.
- *ngenerations*: number of generations.
- *mutation*: mutation ratio.
- *reproduction*: reproduction ratio.
- *adaptation*: adaptation ratio.

and for each variable:

- *nbits*: number of bits to encode each variable.

The total number of simulations to run is:

(number of experiments) x (npopulation) x [1 + (ngenerations - 1) x (mutation + reproduction + adaptation)]

Implemented error norms are:

- **euclidian**: Euclidian norm.
- **maximum**: maximum norm.
- **p**: p-norm. It requires the parameter:
 - *p*: p exponent.

SOME EXAMPLES OF INPUT FILES

Example 1

- The simulator program name is: *pivot*
- The syntax is:

```
$ ./pivot input_file output_file
```

- The program to evaluate the objective function is: *compare*
- The syntax is:

```
$ ./compare simulated_file data_file result_file
```

- The calibration is performed with a *sweep brute force algorithm*.
- The experimental data files are:

```
27-48.txt
42.txt
52.txt
100.txt
```

- Templates to get input files to simulator for each experiment are:

```
template1.js
template2.js
template3.js
template4.js
```

- The variables to calibrate, ranges, precision and sweeps number to perform are:

```
alpha1, [179.70, 180.20], 2, 5

random, [0.00, 0.20], 2, 5
boot-time, [0.0, 3.0], 1, 5
```

- Then, the number of simulations to run is: $4 \times 5 \times 5 \times 5 = 2500$.
- The input file is:

```
