## BUILDING INSTRUCTIONS

This software has been built and tested in the following operative systems. Probably, it can be built in other systems, distributions, or versions but it has not been tested.

Debian 8 (Linux, kFreeBSD or Hurd)

DragonFly BSD 4.6

Dyson Illumos

FreeBSD 11.0

Linux Mint DE 2

OpenSUSE Linux Tumbleweed

Ubuntu Linux 16.10

1. Download the latest **genetic** doing on a terminal:

```
$ git clone https://github.com/jburguete/genetic.git
```

2. Download this repository:

```
$ git clone https://github.com/jburguete/mpcotool.git
```

3. Link the latest genetic version to genetic:

```
$ cd mpcotool/3.4.0
$ ln -s ../../genetic/2.2.0 genetic
$ ln -s genetic/libgenetic.so
```

or in Windows systems:

```
$ ln -s genetic/libgenetic.dll
```

4. Build doing on a terminal:

```
$ ./build
```

Fedora Linux 25

1. In order to use OpenMPI compilation do in a terminal (in 64 bits version):

```
$ export PATH=$PATH:/usr/lib64/openmpi/bin
```

2. Then, follow steps 1 to 4 of the previous Debian 8 section.

Microsoft Windows 7

Microsoft Windows 8.1

Microsoft Windows 10

1. Install **MSYS2** and the required libraries and utilities. You can follow detailed instructions in **install-unix**
2. Then, in a MSYS2 terminal, follow steps 1 to 4 of the previous Debian 8 section.

3. Optional Windows binary package can be built doing in the terminal:

```
$ make windist
```

#### NetBSD 7.0

1. MPI does not work. Follow steps 1 to 3 of the previous Debian 8 section and do in the terminal:

```
$ CC=/usr/pkg/gcc5/bin/gcc ./build
```

#### OpenBSD 6.0

1. Select adequate versions:

```
$ export AUTOCONF_VERSION=2.69 AUTOMAKE_VERSION=1.15
```

2. Then, in a terminal, follow steps 1 to 4 of the previous Debian 8 section.

#### OpenIndiana Hipster

1. In order to use OpenMPI compilation do in a terminal:

```
$ export PATH=/usr/lib/openmpi/gcc/bin:$PATH
```

2. Then, follow steps 1 to 4 of the previous Debian 8 section.

#### Building no-GUI version on servers

On servers or clusters, where no-GUI with MPI parallelization is desirable, replace the 4th step of the previous Debian 8 section by:

```
$ ./build_with_mpi
```

#### Linking as an external library

MPCOTool can also be used as an external library:

1. First copy the dynamic library (libmpcotool.so on Unix systems or libmpcotool.dll on Windows systems) to your program directory.
2. Include the function header in your source code:

```
extern int mpcotool (int argn, char **argc);
```

3. Build the executable file with the linker flags:

```
$ gcc -L. -Wl,-rpath=. -lmpcotool ...
```

4. Calling to this function is equivalent to command line order (see next chapter USER INSTRUCTIONS):

- argn: number of arguments
- argc[0]: "mpcotool"
- argc[1]: first command line argument.

...

- argc[argn-1]: last argument.

## MAKING MANUALS INSTRUCTIONS

On UNIX type systems you need `texlive` installed. On Windows systems you need `MiKTeX`. In order to compile the manuals you can type on a terminal:

```
$ make manuals
```

## MAKING TESTS INSTRUCTIONS

In order to build the tests follow the next instructions:

1. Link some tests that needs genetic library doing in a terminal (assuming that you are in the directory `mpcotool/3.4.0`):

```
$ cd ../tests/test2
$ ln -s ../../genetic/2.0.1 genetic
$ cd ../test3
$ ln -s ../../genetic/2.0.1 genetic
$ cd ../test4
$ ln -s ../../genetic/2.0.1 genetic
```

2. Build all tests doing in the same terminal:

```
$ cd ../../3.4.0
$ make tests
```

## USER INSTRUCTIONS

Optional arguments are typed in square brackets.

- Command line in sequential mode (where X is the number of threads to execute and S is a seed for the pseudo-random numbers generator):

```
$ ./mpcotoolbin [-nthreads X] [-seed S] input_file.xml [result_file] [variables_file]
```

- Command line in parallelized mode (where X is the number of threads to open for every node and S is a seed for the pseudo-random numbers generator):

```
$ mpirun [MPI options] ./mpcotoolbin [-nthreads X] [-seed S] input_file.xml [result_file] [variables_file]
```

- The syntax of the simulator has to be:

```
$ ./simulator_name input_file_1 [input_file_2] [input_file_3] [input_file_4] output_file
```

- The syntax of the program to evaluate the objective function has to be (where the first data in the results file has to be the objective function value):

```
$ ./evaluator_name simulated_file data_file results_file
```

- On UNIX type systems the GUI application can be open doing on a terminal:

```
$ ./mpcotool
```

## INPUT FILE FORMAT

The format of the main input file is as:

```
<?xml version="1.0"?>
<optimize simulator="simulator_name" evaluator="evaluator_name" algorithm="algorithm_type" nsimulations=
  "simulations_number" niterations="iterations_number" tolerance="tolerance_value" nbest="best_number"

  "relaxation_parameter" nestimates="estimates_number" threshold="threshold_parameter" norm="norm_type" p=
  "p_parameter" seed="random_seed" result_file="result_file" variables_file="variables_file">
  <experiment name="data_file_1" template1="template_1_1" template2="template_1_2" ... weight="weight_1"/

```

with:

- **simulator**: simulator executable file name.
- **evaluator**: optional. When needed is the evaluator executable file name.
- **seed**: optional. Seed of the pseudo-random numbers generator (default value is 7007).
- **result\_file**: optional. It is the name of the optime result file (default name is "result").
- **variables\_file**: optional. It is the name of all simulated variables file (default name is "variables").
- **precision**: optional, defined for each variable. Number of precision digits to evaluate the variable. 0 apply for integer numbers (default value is 14).
- **weight**: optional, defined for each experiment. Multiplies the objective value obtained for each experiment in the final objective function value (default value is 1).
- **threshold**: optional, to stop the simulations if objective function value less than the threshold is obtained (default value is 0).
- **algorithm**: optimization algorithm type.
- **norm**: error norm type.

Implemented algorithms are:

- **sweep**: Sweep brute force algorithm. It requires for each variable:
  - *sweeps*: number of sweeps to generate for each variable in every experiment.
 The total number of simulations to run is:
 
$$(\text{number of experiments}) \times (\text{variable 1 number of sweeps}) \times \dots \times (\text{variable n number of sweeps}) \times (\text{number of iterations})$$
- **Monte-Carlo**: Monte-Carlo brute force algorithm. It requires on calibrate:
  - *nsimulations*: number of simulations to run in every experiment.
 The total number of simulations to run is:
 
$$(\text{number of experiments}) \times (\text{number of simulations}) \times (\text{number of iterations})$$
- Both brute force algorithms can be iterated to improve convergence by using the following parameters:

- *nbest*: number of best simulations to calculate convergence interval on next iteration (default 1).
- *tolerance*: tolerance parameter to increase convergence interval (default 0).
- *niterations*: number of iterations (default 1).

It multiplies the total number of simulations:

x (number of iterations)

- Moreover, both brute force algorithms can be coupled with a direction search method by using:

- *direction*: method to estimate the optimal direction. Two options are currently available:

- \* *coordinates*: coordinates descent method.

It increases the total number of simulations by:

(number of experiments) x (number of iterations) x (number of steps) x 2 x (number of variables)

- \* *random*: random method. It requires:

- \* *nestimates*: number of random checks to estimate the optimal direction.

It increases the total number of simulations by:

(number of experiments) x (number of iterations) x (number of steps) x (number of estimates)

Both methods require also:

- *nsteps*: number of steps to perform the direction search method,
- *relaxation*: relaxation parameter,

and for each variable:

- *step*: initial step size for the direction search method.

- **genetic**: Genetic algorithm. It requires the following parameters:

- *npopulation*: number of population.
- *ngenerations*: number of generations.
- *mutation*: mutation ratio.
- *reproduction*: reproduction ratio.
- *adaptation*: adaptation ratio.

and for each variable:

- *nbits*: number of bits to encode each variable.

The total number of simulations to run is:

(number of experiments) x (npopulation) x [1 + (ngenerations - 1) x (mutation + reproduction + adaptation)]

Implemented error norms are:

- **euclidian**: Euclidian norm.
- **maximum**: maximum norm.
- **p**: p-norm. It requires the parameter:
  - *p*: p exponent.
- **taxicab**: Taxicab norm.

## SOME EXAMPLES OF INPUT FILES

### Example 1

- The simulator program name is: *pivot*
- The syntax is:  

```
$ ./pivot input_file output_file
```
- The program to evaluate the objective function is: *compare*
- The syntax is:

```
$ ./compare simulated_file data_file result_file
```

- The calibration is performed with a *sweep brute force algorithm*.
- The experimental data files are:

```
27-48.txt
42.txt
52.txt
100.txt
```

- Templates to get input files to simulator for each experiment are:

```
template1.js
template2.js
template3.js
template4.js
```

- The variables to calibrate, ranges, precision and sweeps number to perform are:

```
alpha1, [179.70, 180.20], 2, 5
alpha2, [179.30, 179.60], 2, 5
random, [0.00, 0.20], 2, 5
boot-time, [0.0, 3.0], 1, 5
```

- Then, the number of simulations to run is:  $4 \times 5 \times 5 \times 5 \times 5 = 2500$ .
- The input file is:

```
<?xml version="1.0"?>
<optimize simulator="pivot" evaluator="compare" algorithm="sweep">
  <experiment name="27-48.txt" template1="template1.js"/>
  <experiment name="42.txt" template1="template2.js"/>
  <experiment name="52.txt" template1="template3.js"/>
  <experiment name="100.txt" template1="template4.js"/>
  <variable name="alpha1" minimum="179.70" maximum="180.20" precision="2" nsweeps="5"/>
  <variable name="alpha2" minimum="179.30" maximum="179.60" precision="2" nsweeps="5"/>
  <variable name="random" minimum="0.00" maximum="0.20" precision="2" nsweeps="5"/>
  <variable name="boot-time" minimum="0.0" maximum="3.0" precision="1" nsweeps="5"/>
</optimize>
```

- A template file as *template1.js*:

```
{
  "towers" :
  [
    {
      "length"      : 50.11,
      "velocity"    : 0.02738,
